
cakephp-upload

Release 3.0.0

Jose Diaz-Gonzalez

Dec 02, 2020

Contents

1	Upload Plugin	1
1.1	What does this plugin do?	1
1.2	This plugin does not do	1

The Upload Plugin is an attempt to easily handle file uploads with CakePHP. It uses the excellent *Flysystem* <<http://flysystem.thephpleague.com/>> library to handle file uploads, and can be easily integrated with any image library to handle thumbnail extraction to your exact specifications.

1.1 What does this plugin do?

- The Upload plugin will transfer files from a form in your application to (by default) the `webroot/files` directory organised by the model name and upload field name.
- It can also move files around programmatically. Such as from the filesystem.
- The path to which the files are saved can be customised.
- The plugin can also upload multiple files at the same time to different fields.
- Each upload field can be configured independently of each other, such as changing the upload path etc.
- Uploaded file information can be stored in a data store, such as a MySQL database.
- You can upload files to both disk as well as distributed datastores such as S3 or Dropbox.
- It can optionally delete the files on record deletion
- It offers multiple validation providers but doesn't validate automatically

1.2 This plugin does not do

- Create thumbnails. You can use a custom Transformer to create modified versions of file uploads.
- It will not convert files between file types. You cannot use it convert a JPG to a PNG
- It will not add watermarks to images for you.
